Safety Information

General Instructions

To ensure safe operation, the device should only be operated according to the specifications in the instruction manual. The requisite Health & Safety regulations for a given application must also be observed. This statement also applies to the use of accessories. Every person who is commissioned with the initiation or operation of this device must have read and understood the operating instructions and in particular the safety instructions!

The liability of the manufacturer expires in the event of damage due to improper use, non-observance of this operating manual, use of insufficiently qualified personnel and unauthorized modification of the device.

Proper Usage

The variable area flowmeters of the DS03 series are used exclusively for monitoring and indicating continuous flows of gaseous and liquid media that do not attack the materials used. All other usage is regarded as being improper and outside the scope of the device.

Process conditions:
liquid media: -20...+100 °C (optional 160 °C), 10 bar
gaseous media: -20...+80 °C, 10 bar

In particular, applications in which shock loads occur (for example, pulsed operation) should be discussed and checked in advance with our technical staff.

In particular applications in which shock loads occur (e.g. intermittent operation) should be discussed and checked in advance with our technical staff.
Do not use flow monitors with fast-switching valves.

The series DS03 flow meter devices should not be deployed as the sole agents to prevent dangerous conditions occurring in plant or machinery. Machinery and plant need to be designed in such a manner that faulty conditions and malfunctions do not arise that could pose a safety risk for operators.
Dangerous substances

For dangerous media such as e.g. Oxygen, Acetylene, flammable or toxic substances as well as refrigeration systems, compressors, etc. must comply with the relevant regulations beyond the general rules.

Qualified Personnel

The DS03 devices may only be installed by trained, qualified personnel who are able to mount the devices correctly. Qualified personnel are persons, who are familiar with assembling, installation, placing in service and operating these devices and who are suitably trained and qualified.

Inward Monitoring

Please check directly after delivery the device for any transport damages and deficiencies. Additional with reference to the accompanying delivery note the number of parts must be checked. Claims for replacement or goods which relate to transport damage can only be considered valid if the delivery company is notified without delay.

Overview

1: Process connection (outlet)
2: Device body
3: Sight glass with measuring scale
4: Float containing magnets
5: Slot nozzle
6: Switch contact and female socket or switch contact with cable
Checking the flow:

In addition to the electrical control by the reed contact (switching contact), the actual flow rate can also be read off the measuring scale of the sight glass. The top edge of the float is the read-off point. To obtain greatest reading accuracy, read-off at eye level. The read-off value can be falsified by viewing at an angle.

Installation

Process connection:

The following requirements must be observed to avoid damage to the flow monitor or the system:

- a process connection suitable for the device must be provided by the customer
- check connection size and screw-in depth
- use suitable sealants (liquid sealants damage the flow monitor if they run in)
- seal properly

Ambient conditions:

- do not install the flow monitor as a supporting part in a pipe system
- the medium must not carry solid bodies. Magnetic particles accumulate on the magnetic float and impair its function.
- Check corrosion and antifreeze agents from the application for compatibility.
Notice:

The following requirements must be observed, otherwise the function of the flow monitor is impaired or measurement results are falsified:

- external magnetic fields will influence the switch contact. Keep sufficient distance to magnetic fields (e.g. electric motors).
- piping, process connections or supports made of ferromagnetic material influence the magnetic field of the device. Keep a space of minimum 100 mm to those materials (e.g. steel).
- changes in cross-section, branch-offs or arcs in the pipe system impair measuring accuracy. Ensure that the unimpeded flow sections are maintained (in front of instrument 10 x nominal diameter, behind the instrument 5 x nominal diameter). Never reduce the pipe diameter immediately before the device.
- in the case of liquid media, take appropriate steps to ensure that the device is vented.
- to ensure measuring accuracy, the device must always be completely filled with medium.
- vent the pipeline. If there are air pockets in the line during the measurement, this could result in damage to the device caused by hydraulic shock. This may cause malfunctions.
- ensure that the plant is operating without cavitation. Cavitation may result in malfunctions and damage to the device.
- ensure that the medium is flowing continuously. Pulse-like staggered loads could destroy the device. This may result in serious injury to the user.
- if the medium is contaminated by solids, a strainer must be installed before the device (e.g. SF00 or SF01 from PKP)

Direction of flow:

Only install the flow monitor in one of the positions displayed in the drawing. The medium must flow in the direction of the arrow (from a low to a high scale value).
Connecting devices equipped with Reed switches

Reed switches are basically designed for small contact ratings. To connect a load with higher power consumption it is indispensable to use a contact protection relay (e.g. our series MSR01).

If you connect directly a load to a Reed contact the following recommendations should be considered.

None of the contact rating values printed on the switching unit must not to be exceeded, even momentarily. This is valid for each of the given values individually: voltage, current, power. The Reed contact integrated in the switching unit is very sensible to electrical overload.

Danger of overload is given by the following applications:

- inductive load
- capacitive load
- lamp load

**Inductive Load**

Inductive loads consist e.g. of relay, contactors, solenoid valves, motors, electric engines, etc.

⚠️ **WARNING:** Voltage spikes at shut down (up to 10 times of nominal voltage)

Protective measures: (examples)

![Diagram of inductive load protection with a flyback diode](image)

(Flyback diode, e.g. type 1N4007)

**Capacitive Load**

Capacitive loads consist e.g. of long connection cables or capacitive consumers.

⚠️ **WARNING:** High current spikes at switching on (this will exceed the nominal current)

Protective measures: (examples)

![Diagram of capacitive load protection with a resistor](image)

Limitation of current by a resistor
**Lamp Load**

Lamp loads consist e.g. by light bulbs, starting motors.

⚠️ **WARNING:** High current spikes at switching on, because the glowing spiral has low resistance at low temperature.

Protective measures: (examples)

Limitation of current by a resistor or preheating of the glowing spiral.

**Connecting to a PLC**

There is no need for protective measures by connecting the Reed switch to a PLC. The Reed contacts are plated by Tunsten, Gold, and Rhodium located in a protective atmosphere. They can be directly connected to the input terminals of a PLC without problems.

**RC-Circuits as protective measures (Boucherot cell, Snubber)**

In practice the following values of resistor/capacitor cells give good results. Nevertheless, the values given in the following tables are only recommendations for general purposes. But it cannot be guaranteed that for specific applications more adequate Boucherot cells may exist.

Electrical connection

The switch contacts employed in these devices are potential free and do not require a power source.

Note:
Switch contacts and flow monitor have been optimally harmonized. After replacement of a switch contact, the switch point must be readjusted.

The contacts open/change when the flow rate falls below the set value.

Grounding of the device:
When installing the device in a pipeline, make sure that the device is grounded via the pipeline. This prevents dangerous potential differences from occurring.

<td><img src="image4" alt="Diagram 4" /></td>
</tr>
</tbody>
</table>

Switch position under no-flow condition
**Setting the switch point**

**Setting the switch point of an installed device:**

The following instructions describe the procedure for a Normally Open Contact (NOC). The actual state (open or closed), can be determined using a continuity meter.

1. Adjust the flow to be monitored and read it off at the scale on the device. The top edge of the float is the read-off point.
2. Loosen the set screw of the switch contact (1)
3. Slowly push the switch contact in the opposite direction of flow up to the stop.
4. **Condition 1: The contact is closed:** Slowly push the switch contact in the direction of flow until the contact opens.
5. **Condition 2: The contact is open:** Slowly push the switch contact in the direction of flow until the contact closes. Keep pushing slowly in the direction of flow until the contact opens.
6. Re-tighten the switch contact set screw using a hex screwdriver. Observe the correct tightening torque of 0.4 Nm.

The set switch point corresponds to the switch-off point of the switch contact by decreasing flow.

**Setting the switch point of a non-installed device:**

1. Loosen the set screws of the switch contact using a flat-bladed screwdriver
2. Using a non-magnetic rod (e.g. test rod), move the float to the point on the measuring scale that corresponds to the flow rate to be monitored. The top edge of the float is the read-off point
3. Slowly push the switch contact in the opposite direction of flow up to the stop
4. **Condition 1: The contact is now closed** Slowly push the switch contact in the direction of flow until the contact opens
5. **Condition 2: The contact is now open** Slowly push the switch contact in the direction of flow until the contact closes, then keep pushing slowly in the direction of flow until the contact opens
6. Tighten the set screws of the switch contact using a flat-bladed screwdriver. When doing so, observe the correct tightening torque (0.4 Nm) of the screws.

The set switch point corresponds to the switch-off point of the switch contact by decreasing flow.
**Electrical connection of analogue transmitter SU20**

**Attention:**

We recommend using only shielded connection cables. The units are equipped with an integrated electronic unit and are ready for operation immediately after installation and connection. Pin 5 must not be contacted electrically! Ideally, use a 4-pole cable. Before connecting the unit electrically, make sure that the supply voltage matches the required one: 24 V\textsubscript{DC} (19...30 V\textsubscript{DC}). Before connecting the unit electrically, the supply voltage must be switched off. The analogue output is factory-set to the specified measuring range.

**Connection:**

Maintenance / Maintenance plan

Intervals for replacing wear parts

DS03 type flow monitors require very little maintenance due to the small number of moving parts. The intervals for the replacement of wear parts depend significantly on the operating conditions as well as on the composition of the medium flowing through the device. For this reason, no intervals have been set by the manufacturer. The operator must determine suitable intervals based on the local conditions and circumstances.

Maintenance work:

- Visual inspection for dirt/soiling
- Visual inspection for free movement of float
- Visual inspection for leaks from the device
- Check function of switch contact

For detailed information on maintenance and cleaning of the device, please refer to a separate manual. Please ask for them if required.

**DS03**

**Variable Area Flowmeter and Switch**

- for low viscosity liquids and gases
- small mounting dimensions
- brass (nickel plated) or stainless steel version
- high switching accuracy
- scales burned into the sight glass
- optional Ex- version acc. to ATEX
- analogue transmitter 4...20 mA optional
- $P_{\text{max}}$: 10 bar, $T_{\text{max}}$: 160 °C

**Description:**
The flowmeter and switch model DS03 works according to a modified variable area principle. The float is guided in an upward tapered measuring tube. The flowing medium moves the float in the flow direction. The upper edge of the float shows the momentary flow via a burnt in scale on the measuring glass.

A Reed contact is mounted outside the meter in a sealed housing. When the float reaches the position of the Reed contact the switch will close. With higher flows the float moves further upward until it reaches a built-in float stop, still keeping the switch closed. This ensures a bistable switch function at any time. The Reed contact is adjustable over the full measuring range of the meter.

**Typical application:**
The variable area flowmeters and monitors DS03 are used to measure and monitor continuous flow rates of low-viscosity liquids or gaseous media.

Areas of applications are:
- cooling systems
- engineering
- medical technology
- pharmaceutical and chemical industries
- research and development
**Models:**

**Measuring ranges:**
- **water:** 0.1...1.5 l/min – 4...50 l/min
- **air:** 3...30 Nl/min – 200...1600 Nl/min

*Referenced to 1 bar abs, 20°C*

**Materials:** brass (nickel plated) and stainless steel

**Technical Data:**

**Max. pressure:** 10 bar

**Pressure loss:** 0,01–0,2 bar

**Max. media-temperature:** 100 °C for liquids (optional 160 °C)

80 °C for gases,

Ex-devices acc. to ATEX-marking

**Electr. Connection:**
- **angle plug acc. to EN 155301-803, form A (DIN 43650),**
- **Ex-contact with 2 m cable**
- **optional:** cable connection round plug M12 x 1 acc. to EN 50044 angle plug with LED or glow lamp

**Accuracy:**
- ± 5 % FS (liquids)
- ± 10 % FS (gases)

**Mounting position:** vertical

**Materials:**

**Protective housing:**
- (non-wetted parts) aluminium anodized

**Brass version (nickel-plated):**

- Wetted parts:
  - float: stainless steel 1.4571 (for liquids)
  - POM (for gases)
  - sight glass: borosilicate glass
  - gaskets: NBR, optional FKM, EPDM

  - all other wetted parts: brass, nickel plated

**Stainless steel version 1.4571:**

- Wetted parts:
  - float: stainless steel 1.4571 (for liquids)
  - POM (for gases)
  - sight glass: borosilicate glass
  - gaskets: FKM, optional NBR, EPDM

  - all other wetted parts: stainless steel 1.4571

**Order Code:**

Accessories (see separate data sheets):

- Needle valves SNV01, SNV02
- Ball valves SKG01, SKG02
- Dirt traps SF00, SF01
- Protection relay MSR01
- M12 Plug connector PVC-cable SM12

Notes:

The specified measuring/switching ranges apply when the instrument is installed vertically and the flow rate is from bottom to top. Other installation positions or operating densities deviating from the specified specifications increase the specified measuring error.

Special scales for different media and operating conditions are available on request.

The specified switching points are shut-off points at falling flow rates. Please note that the switch-on points are higher due to the hysteresis.

For applications where pressure surges are to be expected, please contact PKP!
